Case Study

Charging station Polecharger

Greenway Infrastructure s.r.o.

We have installed 13 Polecharger stations for Greenway, the leading e-mobility provider in Slovakia, at 13 different parking places of TESCO Stores retail chain. Customers are able to charge their electric cars while shopping, helping TESCO provide better customer experience and directly supporting the expansion of green transport alternatives. Charging stations are integrated with lighting system of the parking place, which brought installation cost optimization as we used already existing power lines.

Charging station Polecharger

The charging stations support maximum output of 22 kW, however based on available capacity and client request the power is limited to 11 kW on many locations. The charging stations are compatible with all types of electric vehicles sold in EU (Type 2 charging connector). A clear display with instructions makes charging easy for the customer. The Polecharger can be mounted directly on a pole or on a wall. Authentication takes place via RFID card or the charging station provider's app.
